Usability Heuristics by Jakob Nielsen

1. Visibility of system status

The system should always keep users informed about what is going on, through appropriate feedback within reasonable time.

2. Match between system and the real world

The system should speak the users' language, with words, phrases and concepts familiar to the user, rather than system-oriented terms. Follow real-world conventions, making information appear in a natural and logical order.

3. User control and freedom

Users often choose system functions by mistake and will need a clearly marked "emergency exit" to leave the unwanted state without having to go through an extended dialogue. Support undo and redo.

4. Consistency and standards

Users should not have to wonder whether different words, situations, or actions mean the same thing. Follow platform conventions.

5. Error prevention

Even better than good error messages is a careful design which prevents a problem from occurring in the first place.

6. Recognition rather than recall

Make objects, actions, and options visible. The user should not have to remember information from one part of the dialogue to another. Instructions for use of the system should be visible or easily retrievable whenever appropriate.

7. Flexibility and efficiency of use

Accelerators -- unseen by the novice user -- may often speed up the interaction for the expert user such that the system can cater to both inexperienced and experienced users. Allow users to tailor frequent actions.

8. Aesthetic and minimalist design

Dialogues should not contain information which is irrelevant or rarely needed. Every extra unit of information in a dialogue competes with the relevant units of information and diminishes their relative visibility.

9. Help users recognize, diagnose, and recover from errors

Error messages should be expressed in plain language (no codes), precisely indicate the problem, and constructively suggest a solution.

10. Help and documentation

Even though it is better if the system can be used without documentation, it may be necessary to provide help and documentation. Any such information should be easy to search, focused on the user's task, list concrete steps to be carried out, and not be too large.

S.N.	Usability Heuristics by Jakob Nielsen	Yes	No	Partially	Remarks
1.	Visibility of system status	✓			-Page Title -Navigation Bar
2.	Match between system and the real world	✓			-Contents in user friendly language -Contents in order
3.	User control and freedom	✓			-Navigation Bar on each page.
4.	Consistency and standards	✓			-Use of widely accepted symbols. -Links
5.	Error prevention			✓	-Not so complex system.
6.	. Recognition rather than recall	✓			-Related pictures, logo, symbols. -Titles available
7.	Flexibility and efficiency of use	✓			-Very simple and understandable for expert/newbie -Frequent Action
8.	Aesthetic and minimalist design	✓			-Uniformity in color, text,size and design. -Text-rich -Minimal Design
9.	Help users recognize, diagnose, and recover from errors	✓			-Use of simple language.
